

National Exams December 2017

98-Ind-B1, Applied Probability & Statistics

3 hours duration

NOTES:

1. If doubt exists as to the interpretation of any question, the candidate is urged to submit with the answer paper, a clear statement of any assumptions made.
2. This is a closed book exam. Candidates are permitted to use one of the two permitted calculators (Sharp or Casio models).
3. Candidates are permitted to have an aid sheet consisting of one 8.5" x 11.0" sheet of paper. Writing is permitted on both sides of the paper.
4. This exam consists of three sections (A→C). Within each section, candidates will be given a choice of questions to answer. Please read the instructions for each section carefully. A breakdown of questions and marks is as follows:

Section A:	Do 2 of 4 Questions.	Total marks: 30
Section B:	Do 2 of 3 Questions.	Total marks: 30
Section C:	Do 2 of 3 Questions.	Total marks: 40

Exam:	6 Questions.	Total marks: 100
-------	--------------	------------------

4. The value of each question is listed in the exam. Remember to check the instructions for each section. DO NOT ATTEMPT TO DO ALL QUESTIONS.
5. Statistical tables are provided.

Section A – Basic Concepts: Complete two of the following four questions. This section is worth a total of 30 marks. Do not attempt all questions.

1. An oil drilling company drills in various locations, and its success or failure is independent from one location to another. Suppose the probability of a success at any specific location is 0.25. Furthermore, assume that the time required to drill each well is normally distributed with a mean of 72 days and standard deviation of 3 days.
 - a. What is the probability that the company drills at 10 locations and has exactly 1 success?
 - b. The company will go bankrupt if it drills 9 or more times before its first success. What are the firm's prospects for bankruptcy?
 - c. Assume that the time to drill a well is distributed $N(72,3)$ days. What is the probability that a well will require between 75.0 and 80.0 days?
 - d. If a well took 68.3 days to complete, would this be an unusual event and how would you determine whether this was an unusual event or not?
 - e. Assume that the firm's drilling schedule for the next three years calls for 10 wells to be completed. Give a 95% confidence interval for the expected completion date of the drilling program. You may assume that only one well can be drilled at a time, due to equipment capacity constraints. Ignore the potential for going bankrupt during the drilling schedule.

15 Marks

2. Neko Case is an Industrial Engineer analyzing a manufacturing process. Ms. Case has validated her data collection method and is interested in determining the number of data elements she needs to obtain a “good” confidence interval. Neko has conducted a pilot run of 10 samples and obtained the following data, measuring job time in system.

Replication	TIS (Minutes)
1	112.6
2	105.6
3	95.9
4	94.4
5	97.1
6	92.1
7	109.2
8	120.5
9	110.6
10	98.8

- a) If Ms. Case wishes to obtain an estimate of the true process mean that is accurate to within ± 3 minutes, 19 times out of 20.

- b) Ms. Case later completes a total of 57 replications. Assume the sample average from this later sample is 104.0 with a variance of 100. Develop a 95% confidence interval for the second sample mean.
- c) If Ms. Case were to observe, at some time in the future, a simulation result in which the average job time in system was 110 minutes, would this be considered a statistical anomaly?
- d) Is there any evidence that the results from the pilot run are statistically different from those of the later run?

15 Marks

3. The city of Halifax is considering a high-speed ferry for passengers between Bedford, NS and Halifax City. The ferry would have two classes of customers: regular and executive. Executive passengers would have access to priority boarding and nicer accommodations while in transit. Each ferry trip has an operating cost of \$450. Regular passengers will pay \$3, while priority passengers will pay \$8 per trip. Let X denote the number of regular passengers on a trip and Y denote the number of priority passengers. The joint distribution of X and Y is:

y	x		
	100	150	200
0	0.01	0.01	0.03
10	0.03	0.08	0.07
20	0.03	0.06	0.06
30	0.07	0.07	0.13
40	0.12	0.04	0.03
50	0.08	0.06	0.02

- a. Compute the expected profit of a trip.
- b. Find the marginal probability density of X.
- c. Find the marginal probability density of Y.
- d. Assume that priority passengers are required to book 24 hours in advance. If the ferry operator knows that 20 priority passengers have booked for a particular trip, calculate the expected profit for that particular trip.

15 Marks

4. A function f(x) given below:

$$f(x) = \begin{cases} \frac{2(x+2)}{c}, & 1 < x < 2 \\ 0, & \text{elsewhere} \end{cases}$$

- a. What value must c be for f(x) to be a valid probability function? Why?
- b. Find the mean of the function, under the assumption that it is a valid pdf, using the value for c you discovered in part a.

- c. Find the variance of the function using the value for c you discovered in part
a.

15 Marks

Section B – Intermediate Concepts: Complete two of the following three questions.
This section is worth a total of 30 marks. Do not attempt all questions.

1. As part of a recent study of patients undergoing a particular medical treatment, researchers recorded the demographics of patients in their study, specifically looking at the relationship between body mass index (BMI) and age. The data is below:

Patient	1	2	3	4	5	6	7	8	9
BMI	19.92	20.59	29.02	20.78	25.97	20.39	23.29	17.27	35.24
Age	45.5	34.6	40.6	32.9	28.2	30.1	52.1	33.3	47.0

- a. Fit a regression model for age (x) versus BMI (y) of the form $y = ax + b$
- b. Test for the significance of the regression using $\alpha = 0.05$.
- c. Determine whether the coefficient for x is significant.
- d. Give the expected BMI for a 49.0 year-old individual and determine if we would consider a 49.0 year old with a BMI of 32.5 to be a statistical anomaly.

15 Marks

2. The deflection temperature under load for two different types of plastic pipe is being studied. A pilot study involving two random samples of 10 pipes are tested and the temperature of the pipe at the deflection point is measured (in °F):

Type 1: 206, 188, 205, 187, 194, 193, 207, 185, 189, 213

Type 2: 177, 197, 206, 201, 180, 176, 185, 200, 197, 192

- a. Are the variances of the two samples the same? Using $\alpha = 0.05$ in your calculation.
 - b. Does the data support the supposition that deflection temperature under load for Type 1 exceeds that of Type 2? Use $\alpha = 0.05$ in your calculations. You may assume that deflection temperature is normally distributed and that the variance of deflection temperature is equal in the two types of pipe.
 - c. If the mean deflection temperature for Type 1 exceeds that of type 2 by 2 °F it is important to detect this difference. Can you estimate the sample size needed to be able to detect this difference with a 90% certainty? (You can round your estimates to the nearest 10 observations)
3. In 2008, an engineering professor planted three types of hop plants (*humulus lupulus*), a Williamette plant, a Fuggles plant, and a Centennial plant. Hops are a coniferous plant that produce a flower that is used to bitter beer. Each year, the professor recorded the plant yield (in grams) of the three plants.

W	F	C
118	158	227
118	155	215
135	152	215
126	167	221
130	157	217

- a) Use Bartlett's test to test the hypothesis at the 0.05 level of significance that the population variances of the three growth records are equal.
- b) Assuming that growth on a year-by-year basis is normally distributed, determine using ANOVA whether the plant type significantly affects growth. You may assume, for ease of calculations, that SST is 23047.6 and SSE is a number approximately equal to 460 (it is in fact not exactly 460 – please calculate SSE if possible. If you cannot find SSE, use the value 460).
- c) Using Tukey's test ($\alpha = 0.05$) to determine which, if any, of the plants has a significantly different growth pattern than the other.
- d) Using single degree of freedom comparison determine if the Centennial plant is different from the Williamette and Fuggle plant as a group.

15 Marks

Section C – Advanced Concepts: Complete two of the following three questions. This section is worth a total of 40 marks. Do not attempt all questions.

- After running several marathons, a runner has become convinced that her performance (as measured in time to complete the race) is a distributed function of three elements: x_1 – total number of kilometres she has run in the six weeks prior to the race; x_2 – the longest single run completed during the six weeks prior to the race; and x_3 – the expected temperature on race day. To test this hypothesis, the runner has collected the following dataset:

x_1 Total km (*100)	x_2 Max Dist	x_3 Temp	y Time (Hrs)
4.6	27	11	4.3
4.5	31	10	3.8
4.0	30	25	3.5
4.1	25	22	3.6
4.4	28	14	3.5
4.2	32	17	3.4

The relationship between completion time and (x_1, x_2, x_3) is assumed to be linear in the region of interest.

- Build the $(X'X)$ matrix.
- A partial table of $(X'X)^{-1}$ is given below, where *, **, and *** remain to be determined:

3186.5127	*	-10.0932	-22.9764
-585.1664	108.4063	1.7075	4.2294
-10.0932	1.7075	0.0562	**
-22.9764	***	0.0685	0.1706

- Assume that $(X'X)^{-1}(X'Y)$ is:

-16.29491
4.1060
0.0093
0.1245

Calculate SSE, SSR. You may assume that SST is 0.0548333.

- d. Complete the ANOVA table for this regression model ($\alpha = 0.05$) and determine whether the linear model is a significant predictor of y .
- e. Determine if any of the coefficients in your model is significant at the 95% level.
- f. Based on your analysis, is the model a good predictor of race finishing time?

20 Marks

2. The following data is from an experiment conducted to determine the effect of machine design on photocopier quality. Photocopiers work by essentially gluing ink onto paper using static electricity. Heating and gluing the ink on the paper comprise the final stage of the process. The gluing power during this final process determines the quality of the copy. It is postulated that temperature, surface state of the gluing roller, and hardness of the press roller influence the gluing power of the copier.

Temperature	Surface State	Press (in lb/in ²)		
		20	40	60
Low	Soft	0.52	0.44	0.54
		0.57	0.53	0.56
	Medium	0.64	0.59	0.73
		0.58	0.64	0.78
	Hard	0.67	0.77	0.58
		0.74	0.65	0.59
Medium	Soft	0.46	0.4	0.31
		0.58	0.37	0.48
	Medium	0.6	0.43	0.66
		0.62	0.61	0.57
	Hard	0.53	0.65	0.53
		0.66	0.56	0.47
High	Soft	0.52	0.44	0.54
		0.57	0.53	0.65
	Medium	0.53	0.65	0.53
		0.66	0.56	0.47
	Hard	0.43	0.43	0.48
		0.47	0.44	0.31

An experiment is run with treatments consisting of a combination of these three factors at three levels and an ANOVA is run. The results, as reported by a particular instance of a commercial statistics package, appear below:

ANOVA: Power versus Temperature, Surface Type, Press

Factor	Type	Levels	Values
Temp	fixed	3	Low, Medium, High
Surface	fixed	3	Soft, Medium, Hard
Press	fixed	3	20, 40, 60

Analysis of Variance for Power

Source	DF	SS	MS	F	P
Temp	X	0.166169	0.083084	SSS.S	0.000
Surface	X	0.078252	0.039126	6.70	0.002
Press	X	0.019469	0.009734	1.67	0.195
Temp*Surface	Y	0.128454	0.032113	5.50	0.001
Temp*Press	Y	0.062804	0.015701	2.69	0.037
Surface*Press	Y	0.126437	0.031609	5.41	0.001
Temp*Surface*Press	Z	0.141224	0.017653	3.02	0.005
Error	81	QQQQQQQQ	R.RRRRRR		
Total		AAA	1.196032		

$$S = 0.0764348 \quad R-Sq = TT.T\% \quad R-Sq(\text{adj}) = 47.73\%$$

- d. Fill in the missing values in the above ANOVA table. These are X, Y, Z, AAA, QQQQQQQQ, R.RRRRRR, SSS.S, and TT.T.
- e. Are there any significant interactions between factors? If so, what are they?
- f. Are any of the main factor effects significant? If so which? Are there any for which we are uncertain?
- g. What do we know about the goodness of fit of this model? Is it a good representation of the underlying data?
- h. If a larger number is better, what advice can you provide about how to best optimize the design of photocopiers to produce the best possible quality results.

20 Marks

3. The following data is from a 2^2 factorial experiment, replicated three times.

Treatment	Rep 1	Rep 2	Rep 3
(1)	12	19	10
a	15	20	16
b	24	16	17
ab	23	17	27

- a. Complete the design matrix for this set of experiments
- b. Compute the contrast and mean effects for the main factors and the interaction.
- c. Use ANOVA to determine which, if any, of the factors and interactions are significant. For ease of calculations, you may assume SST is 266.

- d. Fit a linear regression model to the data and determine which regression coefficients, if any, are significant.
