

National Exams December 2013
98-Ind-A5, Quality Planning, Control and Assurance

Notes:

1. If doubt exists as to the interpretation of any question, the candidate is urged to submit with the answer paper, a clear statement of any assumption made.
2. This is a Closed Book Examination.
3. Candidates may use one of two calculators, the Casio or Sharp approved models.
4. Candidates are permitted to bring into the examination room one aid sheet 8½" * 11" written on both sides.
5. Any five questions constitute a complete paper. Only the first five questions as they appear in your answer book will be marked.
6. All questions are of equal value.
7. Relevant statistical tables are attached.

Question1 (20 marks)

- 5 a) Describe the key elements of TQM and the role of the top management in implementing TQM in a company.
- 5 b) Describe the concept of six-sigma quality and explain the level of nonconforming product that could be expected from such a process.
- 5 c) Explain recent trends in supplier-producer relations, the role of quality certification in such relations, and summarize the steps in a quality certification process.
- 5 d) Describe briefly the quality function deployment and its importance in the product design stage. Present an example.

Question2 (20 marks)

- 5 a) Explain the difference between the Pareto chart and histogram and how these two basic SPC tools can be used in process improvement. Show examples.
- 7 b) Can the traditional control charts be used to control processes exhibiting trends? If your answer is yes, explain how such charts can be implemented in parts and process industries.
- 8 c) Explain the difference between EWMA and CUSUM control charts and show examples when such charts are used. Explain the limitations of V-mask used with CUSUM chart. Can a single CUSUM chart be designed considering different positive and negative critical shifts in the process mean?

Question 3 (20 marks)

- 6 a) Explain what information is provided by an operating characteristic function related to an X-bar chart and describe the effect of the sample size on the OC function. What is the value of the OC function when the process is in statistical control?
- 7 b) X-bar and R control charts are kept on the tensile strength of steel beams. The sample size is 5. After 30 samples, the summary information is:

$$\sum_{i=1}^{30} \bar{X}_i = 7518, \sum_{i=1}^{30} R_i = 375,$$

The specifications are: $250 \pm 10 \text{ kg/cm}^2$.

Find the control limits for the \bar{X} and R charts. Assuming the process to be in control, estimate the process mean and standard deviation. If the company wants to make sure that the output tensile strength of the product is not less than 240 kg/cm^2 , what proportion of the output will not meet this criterion?

- 7 c) To control future production, design an \bar{X} chart satisfying the following requirement: when the process mean shifts from μ_0 to $\mu_0 - 1.2\sigma$, (μ_0 and σ are the estimates of the in-control process parameters obtained in 3b), we want to detect this shift on the first or second sample following the shift with the probability greater than or equal to .8. Find the minimum sample size and calculate the control limits for this chart.

Question 4 (20 marks)

- 5 a) Explain the meaning of a stable process and a capable process. How would you perform a capability analysis if the quality characteristic is not normally distributed?
- 5 b) Should the process be in statistical control when performing capability analysis? Why or why not? Explain the differences between capability indices C_p , C_{pk} and C_{pm} . What is the relation between C_p and C_{pk} ?
- 10 c) Suppose, for a given process, the estimates of C_p and C_{pk} are 1.33 and 1.05, respectively. Assuming that the process follows a normal distribution, and two-sided specification limits are used (LSL and USL), estimate the process fraction nonconforming. Estimate C_{pm} , if the target value $T=(USL+LSL)/2$. How would the process fraction nonconforming change if the process mean is centered?

Question 5 (20 marks)

- 6 a) Discuss the advantages and disadvantages of the control charts for variables and attributes. Explain why a pair of charts is used for variables and only a single chart for an attribute. What is a demerit chart?
- 7 b) The manufacturer wishes to set up a control chart at the final inspection station for a gas water heater. Defects in workmanship are checked in this inspection. The inspection unit is defined as 1 water heater and for the last 20 working days, 20 samples, each of size $n=4$ water heaters were inspected and the total number of 40 nonconformities were reported. Suggest a control chart for this process and calculate the control limits. Assuming the process to be in control, estimate the expected number of defects per one water heater.
- 7 c) To control future production, the inspection unit is re-defined as 2 water heaters. Considering the same sample size $n=4$, calculate the control limits using the data in 5b).

Question 6 (20 marks)

- 7 a) Explain the difference between the AQL-based sampling plans(such as MIL-STD-105E) and the Dodge-Romig's AOQL and LTPD sampling plans. Which of these plans controls both producer's and consumer's risk? Explain meaning of AQL, AOQL, and LTPD.
- 6 b) In what situations would you recommend sequential testing and why? Show an example and discuss the differences between a multiple sampling and sequential sampling plan.
- 7 c) Items are submitted for inspection in lots of 5,000. The required AQL is 1.5%. Consider normal inspection and general inspection level II. Find a single sampling plan using MIL-STD-105E. Calculate the producer's and consumer's risks for LQL=6%.

Appendix VI Factors for Constructing Variables Control Charts

Observations in Sample, <i>n</i>	Chart for Averages			Chart for Standard Deviations			Chart for Ranges									
	Factors for Control Limits			Factors for Center Line			Factors for Control Limits			Factors for Center Line			Factors for Control Limits

For *n* > 25

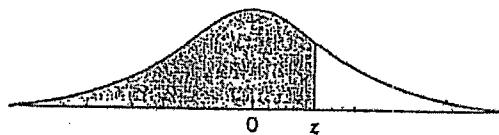

$$A = \frac{3}{\sqrt{n}}, \quad A_3 = \frac{3}{C_4\sqrt{n}}, \quad C_4 = \frac{4(n-1)}{4n-3},$$

$$B_3 = 1 - \frac{3}{C_4\sqrt{2(n-1)}}, \quad B_4 = 1 + \frac{3}{C_4\sqrt{2(n-1)}},$$

$$B_5 = C_4 - \frac{3}{\sqrt{2(n-1)}}, \quad B_6 = C_4 + \frac{3}{\sqrt{2(n-1)}}.$$

Table 14-4 Sample Size Code Letters (MIL STD 105E, Table 1)

Lot or Batch Size	Special Inspection Levels				General Inspection Levels		
	S-1	S-2	S-3	S-4	I	II	III
2 to 8	A	A	A	A	A	A	B
9 to 15	A	A	A	A	A	B	C
16 to 25	A	A	B	B	B	C	D
26 to 50	A	B	B	C	C	D	E
51 to 90	B	B	C	C	C	E	F
91 to 150	B	B	C	D	D	F	G
151 to 280	B	C	D	E	E	G	H
281 to 500	B	C	D	E	F	H	J
501 to 1200	C	C	E	F	G	J	K
1201 to 3200	C	D	E	G	H	K	L
3201 to 10000	C	D	F	G	J	L	M
10001 to 35000	C	D	F	H	K	M	N
35001 to 150000	D	E	G	J	L	N	P
150001 to 500000	D	E	G	J	M	P	Q
500001 and over	D	E	H	K	N	Q	R

Table 13.5 Master Table for Normal Inspection—Single Sampling (MIL-STD-105E, Table II-A)

Sample size code letter	Sample size	Acceptable Quality Levels (normal inspection)																									
		0.010	0.015	0.025	0.040	0.065	0.10	0.15	0.25	0.40	0.65	1.0	1.5	2.5	4.0	6.5	10	15	25	40	65	100	150	250	400	650	1000

→ = Use first sampling plan below arrow. If sample size equals, or exceeds, lot or batch size, do 100 percent inspection.

Ac = Acceptance number.
Re = Rejection number.
